22/09/2025 to 30/04/2026

Details

MODULE DETAILS:

Module Number:	600091	Trimester:	2
Module Title:	Honours stage project		
Lecturers:	Dr P A Robinson		

COURSEWORK DETAILS:

Assessment Number:	3 of 3		
Title of Assessment:	Final report		
Format(s):	Report	Demonstration	Video
Method of Working:	Individual		
Workload Guidance:	Typically, you should expect to spend between 100 and 120 hours on this assessment		
Length of Submission:	Over length submissions will be penalised according to University policy. This assessment should be no more than:	16000	

PUBLICATION:

Date of issue:	22/09/2025
----------------	------------

SUBMISSION:

One copy of this assessment should be handed in via:	Canvas	If Other (state method)	N/A	
Time and date for submission:	Time	14:00	Date	23/4/2026

If multiple hand-ins please provide details:	N/A	
Will submission be scanned via TurnitinUK?	Yes	Where submissions are scanned by TurnitinUK, filetypes must be one of the following Word, RTF, PDF, PPT, XLS etc. Students MUST NOT submit ZIP or other archive formats. Students are reminded they can ONLY submit ONE file and must ensure they upload the correct file. The last uploaded file will be the one marked – and if after the submission deadline may incur a late penalty.

The assessment must be submitted no later than the time and date shown above, unless an extension has been authorised. Canvas allows multiple submissions: only the last assessment submitted will be marked and if submitted after the coursework deadline late penalties may be applied.

MARKING:

Marking will be by:	Student name
---------------------	--------------

ASSESSMENT:

The assessment is marked out of:	100	and is worth	80	% of the module marks
----------------------------------	-----	--------------	----	-----------------------

ASSESSMENT STRATEGY AND COMPETENCIES:

The overall assessment strategy is designed to evaluate the student's achievement of the programme competencies, and is subdivided as follows:

Competencies		Method of Assessment
CP1	With little or no guidance, students will be able to use critical and creative thinking, appropriate research and problem solving to develop innovative solutions, and critically evaluate and effectively communicate the processes and outcomes.	Report
CP2	With little or no guidance, students will be able to identify, assess and plan mitigation for project risks. Identify and evaluate ethical and legal issues associated with proposed projects and activities.	Report
CP3	With little or no guidance, Students will be able to select and use appropriate development tools and practices,	Report

	applying them to solve problems and develop or maintain software.	
CP5	With little or no guidance, Students will be able to select, design, implement and evaluate a range of algorithms according to functional and non-functional requirements.	Report
CP6	With little or no guidance, students will be able to design and engineer software/hardware-based systems that, where appropriate, consider scalability, reliability, efficiency, maintainability, resilience, security, usability and accessibility.	Report
CP8	Students will be able to review, reflect and document consequences of personal decisions that impact upon their capacity to study effectively and on their general well-being. Review, reflect, plan and maintain a diverse professional portfolio of experience that fosters life-long learning.	Report

Programme-specific competency

Depending on which degree you are studying, you will also need to demonstrate the relevant programme-specific competency, as below.

CS is Computer Science, SE is Computer Science (Software Engineering), CSGD is Computer Science for Games Development, CSAI is Computer Science (Artificial Intelligence) and RAI is Robotics and Artificial intelligence.

CS	Apply Computer Science theory and techniques to solve authentic problems, for example, through the use of Advanced Computational Architectures, and appropriate programming paradigms and algorithms.	report, informed by software
CSSE	Use established software development methodologies to discover authentic requirements, respond to change, ensure quality and deliver value to users and stakeholders.	report, informed by software
CSGD	Able to apply programming skills to solve authentic problems in games specific contexts.	report, informed by software
CSAI	Programme established and novel Artificial Intelligence techniques to solve authentic problems and respond to change, keeping ethics, data management and safety in focus.	report, informed by software
RAI	Program, develop, test and optimise robotic platforms to solve authentic problems using Artificial Intelligence techniques ensuring the safety of humans, robots, and the environment	report, informed by software and/or hardware

For details of the mark scheme, please see the attached Canvas rubric.

FEEDBACK:

Feedback will be given via:	Verbal, Canvas	Additional feedback will be given via:	N/A
Exemption (staff to explain why)	N/A		
Feedback will be provided no later than 20 working days after the submission date.			

This assessment is set in the context of the competencies for the module and does not by itself constitute a definitive specification of the assessment. If you are in any doubt as to the relationship between what you have been asked to do and the module content you should take this matter up with the member of staff who set the assessment as soon as possible.

You are advised to read the **NOTES** regarding late penalties, over-length assignments, unfair means and quality assurance in your student handbook, which is available on Canvas.

Assignment Details

ACW2 - Final report

The final report on your project is a formal document. Its aim is to summarise the work you have done over the whole module, to analyse it critically and reflect upon it. We will be discussing in detail the report and how to create it in lectures. A [template document](https://canvas.hull.ac.uk/courses/76100/files/6633575?wrap=1)

(<https://canvas.hull.ac.uk/courses/76100/files/6633575?wrap=1>)_ ↓

(https://canvas.hull.ac.uk/courses/76100/files/6633575/download?download_frd=1) is available to help you.

Style and presentation is important for this report, which is probably the most substantial piece of work you will submit during your degree programme. To help you create your report, you will be provided with a template document for guidance (which you may edit). The template shows the broad structure of the report and is a guide as to the expected content; your project may have different requirements and if so you should modify it appropriately where necessary. You may elect to insert new sections and/or remove some which are not relevant to your project, but bear in mind the marking criteria as you do so. You will certainly want to create more subsections to present your material in a logical manner. In most cases, there should be no need to change the general layout, font or paragraph styles.

The report must be written in the third person, passive voice ("*Software was developed to...*" and not "*I wrote software to...*"). This is a formal report, not a journal. Critical thinking is required; you should document what is important to the project, and not every last detail. The report should be written at a technical level suitable for a reader who is not necessarily familiar with your project, but is fully aware of general computing principles and issues. It may help to think that one of the functions of the report is to help someone else to replicate your work in future without encountering the problems that you have already solved.

Images - charts, screenshots, UML diagrams and others - are welcome in your report. Include them at appropriate places in the text to illustrate particular points. Refer to the images in your text, and give each one a caption. If you do not generate the images yourself, make sure you attribute them properly in accordance with good referencing practice.

References

As is the case with any formal scientific document, you must properly reference the work of others when you make use of it (Witwicky 1897). You must use the approved standard for citing and compiling references, available online at <http://libguides.hull.ac.uk/referencing/harvard> (<http://libguides.hull.ac.uk/referencing/harvard>). To avoid suspicion of plagiarism, be very careful not to use the work of others without properly acknowledging it. Do not copy and paste large chunks of text from elsewhere.

If you do have good reason to quote text from elsewhere, make sure it is properly marked and acknowledged. If your software uses code libraries or other sources, make it very clear in your report which parts are not your work.

Word count

In accordance with University policy, you **must** include a word count on the front page of your report. This can be determined by submitting it to the draft submission sandpit assignment before making your final submission. The word count will include all words in the document. *There are no exceptions for headers, tables, references or any other entities.* To accommodate these, the word limit in the rubric has been increased. Additionally, please do not include any appendices as part of your main document. If you need to include such material (which is not assessed), then create a separate document called "appendices.pdf" and submit this alongside the main report. Do not zip these together.

University policy *requires* penalties to be applied to over-length submission, so please be careful. Remember the word count is a limit, not a target.

Submission

There are three elements to the submission. All are compulsory.

1. You must submit your final report in PDF format, not zipped or compressed in any way. You must submit through Canvas, and your submission will be scanned by Turnitin.
2. You may also, if you wish, submit a separate document called "appendices.pdf" which includes material you would otherwise have put in appendices in the main document. This will not be marked.
3. You must also submit the source code of any software you have developed, as a single ZIP archive. This must also be submitted via Canvas (to a separate assignment).

4. You must submit a short showcase video of your project. This must also be submitted via Canvas (to a separate assignment).

Assessment

Your work will be double marked, by your project supervisor and the second marker. There will also be a compulsory meeting (the 'demo') with both of your markers during which you will be expected to present your project, demonstrate any software or hardware you have developed and answer questions.

Please be aware that while this assignment specification is the same for all degree programmes, you will need to demonstrate that you have achieved the programme-specific competency relevant to your degree (see the list of competencies above). This will be assessed as part of the 'technical achievement' element of the mark scheme. Keep this in mind and make sure you are working towards the right goals.

Your project will be marked according to the following criteria for excellence, which are subdivided into the categories in the rubric:

Element	Marks	Description
Abstract and introduction	10	An excellent report will present a succinct and detailed abstract summarising the nature of the work, the methodology and the main results. The abstract will provide a good overview of the whole report to a reader unfamiliar with the project. An excellent introduction will set the project context, providing a concise and cogent overview of the professional, social, legal and ethical issues involved, followed by a statement of the project goals (aims and objectives). The deeper discussion of the broad context will appear in later sections of the report, including a thorough analysis of the specific application domain and requirements, and identify the technical principles, tools and methods to be applied. This detailed discussion will be supported by appropriate examples, illustrations, and properly presented references.
Literature review	15	An excellent literature review will provide a clear starting point for the project. It will examine the state of the art in the relevant field, show where similar work has already been done and make clear where there is scope for further work. Discussion will demonstrate a breadth of awareness and solid understanding of relevant principles and techniques. Full source references will be made to background material on all significant issues concerned, including traditional and formal academic sources. A high class report will be further strengthened by a critical appraisal of the problem domain.
Technical achievement	45	An excellent project report will demonstrate a high level of technical achievement, in terms of the work conducted and the standard of technical deliverables, <i>taking into account the relevant programme-specific</i>

Element	Marks	Description
		<i>competency</i> . Software will be solidly designed, engineered and documented, showing insight and flair. The design will be presented thoroughly using diagrams as appropriate. Software will be robustly and efficiently implemented to meet all requirements with an appropriate and effectively styled user interface, and appropriate system and user documentation. Non-software development aspects will be equivalently professional and thorough in their conduct and final delivery, for example well evidenced and argued conclusions of investigative research, showing insight and flair.
Process and management	10	An excellent project will show evidence of good planning, project management and implementation of appropriately chosen, well-defined software development or research processes. This element of the assessment will take into account organisation of and attendance at project meetings, reviews and demonstrations. Excellent project management will show evidence of appropriate time management, decision making with relation to resources and delivery against plans and goals.
Critical evaluation and conclusions	10	All aspects of the project process and outcomes will be reflectively reviewed, considered against relevant standards, and appraised relative to stated goals. Evidence will be presented of relevant testing and evaluation by users if appropriate. Project outcomes or research results will be clearly presented and their ramifications considered. Opportunities for further refinement will be discussed and potential future developments identified and appraised. Within this critique, an excellent report will further demonstrate insight, depth and breadth of understanding of the discipline.
Referencing	5	An excellent set of references will indicate a wide scope of relevant research sources, including some or all of the following: academic papers, textbooks, technical sources, application domain-related materials, general contexts, in both traditional and modern media (including websites). All references will be presented in full and linked to narrative consistently according to the Harvard protocol, in line with departmental policy.
Presentation and quality of writing	5	An excellent report will have a highly professional standard of presentation, consistently neat layout and minimal errors of grammar and spelling. The report will be logically sectioned, with further attention paid to appropriate use of type size and style for additional sub-headings and narrative emphasis where appropriate. Illustrations will be neatly prepared and positioned appropriately in relation to their relevant narrative discussion - in line or cross-referred to an appendix. Presentation of data will be done using appropriate graphical techniques. Large or complex diagrams or data tabulations will be presented as appendices, with

Element	Marks	Description
		suitable illustrative extracts placed within the narrative if it aids understanding.

Showcase Video

You also need to create and submit a short video that showcases your delivered project. The particular nature of your project may have an impact on what you choose to include in the video. It may show off features of your delivered software, results of experiments, and/or the algorithms that you have developed. It should certainly include an introduction that informs the user about what they are watching.

As a rough guideline, aim for around 10 minutes. There is a hard file size limit of 1 GB and you should be submitting only the video file (no zips) using your nine-digit student number as a file name (e.g. "2016123456.mp4"). There are no specified quality attributes, but think about what you expect when using services such as YouTube; you probably want to aim at 720p and above for resolution and around 30fps and above. Don't expect viewers to be able to read small text on a highly compressed video!

In some cases, the video can form part of, and/or inform, your demo. This may be particularly useful in projects that are impractical to demo indoors (such as with GPS based apps for example). You are encouraged to produce these to a high quality and use it as part of your online portfolio when applying for jobs. Your work may also be given exposure as part of a department showcase of projects on our website. The video should be uploaded to Canvas via the relevant assignment.

Please note: because we may use this video in our showcase of student work, or in other ways for publicity, you must ensure that you do not include any copyright material.

Further information

Further information will be made available through the Canvas site and at lectures as appropriate.

File permitted: PDF

or

 Canvas Files

It is recommended you submit PDF files for your assignments. This will ensure maximum compatibility with Turnitin and assessment software.

All versions of Word can save as PDF. Click "Save as..." and choose "PDF" as the document type.

If you are required to submit a word count as part of your submission, you can add it in the comments box when submitting your files.

☐ I agree to the tool's **End-User License Agreement**
(https://api.turnitinuk.com/api/lti/1p0/user/static_eula)

I take full responsibility for my submitted piece of work and have acknowledged all sources of material in accordance with the required referencing style (e.g. Harvard). The required referencing style has been communicated to me in the assessment brief or by other means. My work is not copied and I have acknowledged work and ideas of others by correct referencing in all relevant sections. I understand improper referencing places me at risk of a reduced mark or the penalties of the University's academic misconduct regulations.
